01 / IDENTITY AND CONCEPT

NCPortfolio

A personal portfolio app designed for a recruiter to understand the student's profile quickly, even when internet access is unavailable.

My name is NDATIMANA Christine.

Student	NDATIMANA Christine
Registration number	25/27201
Verification code	MOB-A2-7201
Application name	NCPortfolio
Primary audience	Recruiters, internship reviewers and innovation-challenge evaluators.
Platform	Android application built with React Native, Expo and TypeScript.

Concept

NCPortfolio presents identity, skills, education, genuine student projects and editable profile information in a compact mobile experience. The visual direction uses a light neutral background, a calm green accent, simple cards and clear bottom-tab navigation. The interface is intended to feel professional, readable and easy to demonstrate on a narrow Android phone.

Clear identity

The Home screen begins with the exact required sentence, followed by a professional headline, short biography and verification code.

Offline-first core

Core portfolio content is stored locally so the recruiter can still review the app when network access is unavailable.

Evidence of work

Projects open into separate detail screens that explain the problem, contribution and technologies used.

Personal editing

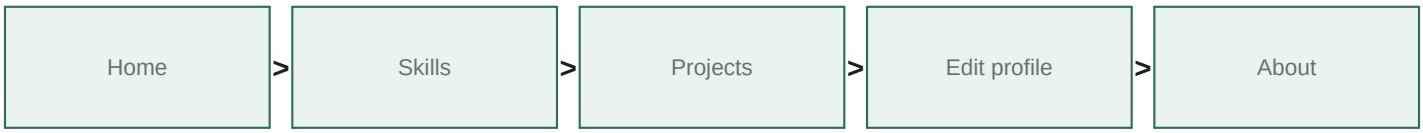
The profile editor uses controlled fields, validation and local persistence so changes remain after restart.

02 / USER FLOW AND INFORMATION ARCHITECTURE

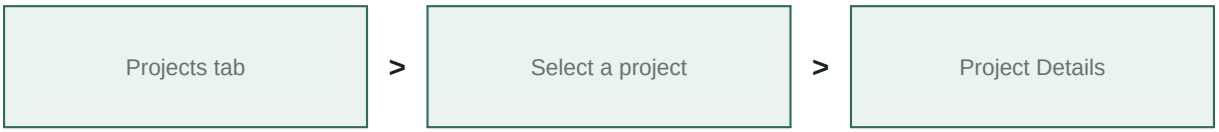
How the recruiter moves through the app

Bottom tabs are used for major sections, while Project Details opens through a nested stack route.

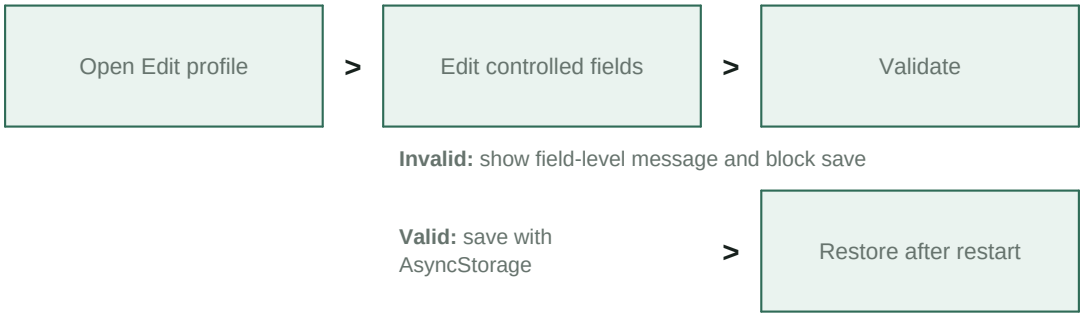
Primary navigation



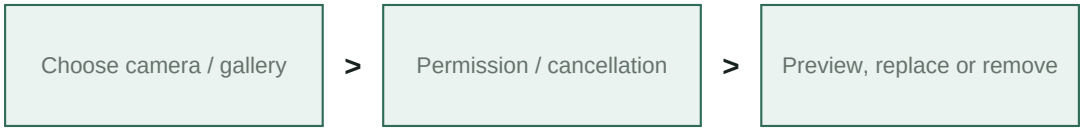
Project detail stack



Profile editing and saved-state flow



Profile media flow



State principle: navigation changes screens, while editable profile values and the selected local image reference remain available through local persistence.

03 / ANNOTATED WIREFRAMES

Home, Skills and Projects

Wireframes focus on hierarchy, reusable cards and the information a recruiter needs first.

HOME
Identity My name is NDATIMANA Christine.
Profile area Student-created avatar or profile image
Headline Professional headline
Biography Short personal introduction
Verification MOB-A2-7201
Bottom tabs Home | Skills | Projects | Edit profile | About

SKILLS
Section intro Skills and education / training
Reusable skill cards At least five genuine skills presented consistently
Education timeline Concise education or training milestones
Responsive behavior Cards stack cleanly on narrow Android screens
Bottom tabs Home | Skills | Projects | Edit profile | About

PROJECTS
Section intro Genuine student project portfolio
Project card 1 Title + short problem summary + technology
Project card 2 Title + short problem summary + technology
Action Tap a card to open a separate Project Details screen
Bottom tabs Home | Skills | Projects | Edit profile | About

Key annotations

1. Identity is visible immediately on Home.

2. Skills use reusable components rather than isolated one-off layouts.

3. Education is summarized alongside skills to keep the portfolio concise.

4. Project cards stay brief; detailed evidence is moved to the nested Project Details route.

5. Bottom tabs remain visible for major sections and support quick two-minute review.

04 / ANNOTATED WIREFRAMES

Project Details and Profile Editor

These screens show the nested stack route, controlled inputs, visible validation and local media workflow.

PROJECT DETAILS	
Project title	Name of the selected genuine student project
Problem	What problem the project addresses
Contribution	What the student personally implemented
Technology	Technologies actually used
Back behavior	Android Back returns to Projects and preserves the session

EDIT PROFILE	
Headline	Controlled text field
Biography	Controlled multi-line field
Primary skill	Controlled field or selector
Availability	Controlled status value
Validation example	A required or too-short value shows a field-level message.
Save	Invalid save is blocked; valid data is stored locally

Media and error states

Permission denied

The app explains that permission was not granted and remains usable instead of crashing.

Selection cancelled

Cancelling camera/gallery selection returns safely to the screen with the previous state intact.

Image selected

The selected local image is previewed and offers replace and remove actions.

Invalid profile

Field-level messages identify the problem and the Save action remains blocked.

Valid profile

Validated values save to AsyncStorage and remain available after a restart.

Offline state

Core portfolio content remains readable; optional internet-only actions are clearly secondary.

05 / VISUAL AND ACCESSIBILITY DECISIONS

Readable, restrained and consistent

The design prioritizes clarity on a narrow Android phone and supports increased system text size.

Color system

Role	Sample	Use
Primary green		Active tab, buttons, emphasis and section accents
Light green		Selected / highlighted surfaces
Neutral background		Main app background
Primary text		Headings and body text
Error red		Field-level validation feedback

Typography and spacing

The interface uses a clear hierarchy: larger bold headings, medium-weight section labels and readable body text. Spacing separates cards and form groups without wasting screen space. Touch targets are kept large enough for comfortable Android use, and layouts rely on Flexbox so content can wrap instead of being clipped.

Contrast

Dark text is used on light backgrounds. Green is reserved for emphasis and selected states rather than low-contrast body copy.

Labels

Form fields and important controls have visible labels; icons support meaning instead of replacing essential text.

Large text

Layouts allow text to wrap, avoid fixed-height text containers and keep critical controls reachable when system font size increases.

Motion and feedback

Navigation and validation feedback are simple and immediate. The app does not depend on decorative animation to communicate state.

Offline readability

Core text, cards and local images remain available without a network connection.

Error recovery

Permission denial, cancellation and invalid fields return clear feedback and preserve the user's existing state.

Implementation note: Final visual evidence should remain consistent with the submitted NCPortfolio build. If any genuine student content is changed before submission, update the affected screenshots or wording in this PDF so the document continues to match the final application.
